

Wayne Enterprises Gotham City Intelligence Analysis – Intelligence Report

Report prepared and analytics conducted by Soham S. Amburle | 29 June – 10 July 2026

The Wayne Enterprises Gotham City Intelligence Analysis Dashboard provides an executive-level intelligence view of Gotham City's criminal activity by analyzing crime incident volume, crime severity, resolution performance, response-time performance, crime types, geographic concentration, and crime trends. Developed using Power BI and a large-scale synthetic enterprise dataset, the dashboard simulates how Wayne Enterprises could monitor and evaluate criminal activity across Gotham City and other simulated regions, identifying patterns that may require greater intelligence, security, and operational attention.

In complex urban environments, intelligence and security teams play a critical role in monitoring criminal activity, identifying emerging threats, evaluating incident severity, maintaining effective response performance, and understanding geographic and temporal crime patterns. Organizations must continuously evaluate crime activity while identifying areas of elevated risk, monitoring unresolved cases, and assessing the effectiveness of incident response.

This dashboard has been designed to provide decision-makers with a centralized Gotham City intelligence platform that enables leadership teams, intelligence analysts, security teams, and business analysts to monitor crime activity, evaluate severity, assess response performance, understand resolution outcomes, and support data-driven security decisions.

Unlike traditional crime reports that focus primarily on incident counts or individual cases, this dashboard integrates crime-volume analysis, resolution-rate monitoring, severity assessment, response-time measurement, crime-type comparison, geographic analysis, and time-based crime trends into a unified intelligence environment.

The dashboard helps answer critical strategic questions such as:

1. How many crime incidents have been recorded?
2. What percentage of crime incidents have been resolved?
3. How many high-severity crime incidents have occurred?
4. What is the average response time to crime incidents?
5. How many crime incidents remain unresolved?
6. What is the overall severity level of recorded crime?
7. What percentage of high-severity incidents have been resolved?
8. Which crime types occur most frequently?
9. Which regions have the highest concentration of crime incidents?
10. How does crime activity change over time?

By integrating KPI indicators, crime analytics, severity analysis, geographic crime analysis, response-time measurements, and interactive filtering capabilities, the dashboard delivers a comprehensive overview of Gotham City's criminal intelligence environment.

Data Disclaimer:

This dashboard uses a fully synthetic dataset created for educational, analytical, and portfolio demonstration purposes only. The project is inspired by the fictional universe of Wayne Enterprises from DC Comics and does not represent any real corporate data.

Dashboard Storyline

The dashboard follows a structured intelligence analysis storytelling approach that guides stakeholders from high-level crime performance indicators toward deeper crime-type, geographic, severity, and temporal analysis.

1. Gotham City Crime Intelligence Performance Snapshot

The dashboard begins with a high-level Gotham City crime intelligence overview through KPI cards, allowing Bruce Wayne, Lucius Fox, intelligence analysts, security teams, and business analysts to immediately assess overall incident activity, resolution performance, high-severity cases, response performance, unresolved incidents, overall severity, and high-severity resolution performance.

The KPI layer establishes an immediate understanding of the scale and seriousness of criminal activity before users move into more detailed intelligence analysis.

2. Crime Trend Analysis

The Crime Trend visualization evaluates the number of recorded crime incidents across time.

This enables decision-makers to identify periods of increasing or decreasing crime activity, recurring patterns, and changes in the overall volume of criminal incidents. Monitoring crime activity over time provides an important foundation for identifying potential changes in Gotham's security environment.

3. Crime by Type Analysis

The Crime by Type visualization evaluates the number of crime incidents across different crime categories.

This enables intelligence teams to identify the most frequently occurring types of criminal activity and understand where crime volume is concentrated. Comparing crime categories also provides insight into the nature of criminal activity affecting the monitored regions.

4. Crime by Region Analysis

The Crime by Region visualization evaluates crime incident concentration across different cities and regions.

Data Disclaimer:

This dashboard uses a fully synthetic dataset created for educational, analytical, and portfolio demonstration purposes only. The project is inspired by the fictional universe of Wayne Enterprises from DC Comics and does not represent any real corporate data.

This provides geographic visibility into criminal activity and allows decision-makers to identify areas experiencing higher incident volumes. Geographic comparison can support further intelligence investigation, resource planning, and security prioritization.

5. Crime Severity Distribution Analysis

The Severity Distribution visualization evaluates how recorded crime incidents are distributed across Low, Medium, and High severity levels.

This allows stakeholders to understand the overall threat composition of criminal activity and determine whether incident volume is primarily associated with lower-severity events or more serious threats.

Severity analysis provides an additional intelligence dimension beyond total incident volume, allowing leadership to evaluate not only how much crime is occurring but also how serious that activity is.

6. Crime & Geographic Exploration

Interactive crime-type and geographic filters allow stakeholders to isolate specific categories of criminal activity and locations and evaluate their incident volume, severity, response performance, and resolution outcomes.

This enables more focused intelligence investigations and allows analysts to move from a broader crime overview toward specific crime categories and geographic areas.

7. Severity Assessment

The Severity filter provides additional flexibility for examining criminal activity according to incident severity.

This allows decision-makers to isolate Low, Medium, or High severity incidents and investigate how crime activity changes when filtered according to threat level.

8. Temporal Crime Analysis

Interactive Year and Month filters allow stakeholders to investigate crime activity across specific time periods.

This enables analysts to identify seasonal patterns, changes in incident volume, and periods requiring closer intelligence attention.

9. Crime Resolution Assessment

The Resolution Rate, Unresolved Cases, and High-Severity Resolution indicators provide visibility into the effectiveness of incident resolution.

This allows stakeholders to assess how effectively recorded incidents are being resolved while separately evaluating the resolution performance associated with high-severity cases.

10. Intelligence Decision Support

The dashboard functions as a strategic Gotham City intelligence platform that supports crime monitoring, severity assessment, geographic investigation, response-performance evaluation, resolution analysis, and security strategy development.

11. Enterprise-Wide Gotham City Intelligence Visibility

Together, the KPI indicators, crime-type analysis, geographic concentration, severity distribution, crime trends, and interactive filtering capabilities create a unified Gotham City intelligence environment where stakeholders can move from high-level crime metrics to detailed incident investigations within a single interactive dashboard.

Dashboard Elements – Visuals & Analytics

The dashboard consists of three major analytical layers:

Data Disclaimer:

This dashboard uses a fully synthetic dataset created for educational, analytical, and portfolio demonstration purposes only. The project is inspired by the fictional universe of Wayne Enterprises from DC Comics and does not represent any real corporate data.

KPI Cards

Seven KPI indicators summarize the overall performance of Gotham City's crime intelligence environment:

1. Total Incidents
2. Resolution Rate
3. High-Severity Cases
4. Avg Response Time
5. Unresolved Cases
6. Avg Severity
7. High-Severity Resolution

These KPIs provide a quick understanding of overall crime activity, resolution effectiveness, threat severity, response performance, unresolved incident volume, overall severity, and high-severity case resolution.

Interactive Slicers

Seven slicers allow dynamic exploration across crime, geographic, severity, and temporal dimensions:

1. Year
2. Crime Type
3. Severity
4. City
5. Country
6. Month
7. Region Type

All dashboard visuals dynamically respond to slicer selections, enabling flexible crime analysis across different time periods, crime categories, severity levels, cities, countries, and regional classifications.

Main Visualizations

1. **Crime Trend (Line Chart):** Tracks crime incident activity over time and identifies changes, patterns, and periods of increased or decreased criminal activity.
2. **Crime by Type (Clustered Column Chart):** Evaluates the number of crime incidents across individual crime categories and identifies the areas with the greatest criminal activity.
3. **Crime by Region (Bar Chart):** Compares crime incident volumes across different cities and regions and provides visibility into geographic crime concentration.
4. **Severity Distribution (Donut Chart):** Evaluates the proportion of crime incidents across Low, Medium, and High severity levels and provides an overview of the overall threat composition.

Strategic Value for Leadership & Decision-Makers

This dashboard provides several strategic advantages for enterprise leadership, intelligence analysts, security teams, business analysts, and operational decision-makers.

It enables stakeholders to monitor overall crime activity while identifying the crime types, geographic areas, and severity levels that contribute most significantly to Gotham's criminal environment. By combining incident metrics, resolution-rate analytics, severity indicators, response-time measurements, geographic analysis, and crime trends, leadership can make more informed decisions regarding security planning, intelligence prioritization, and operational resource allocation.

The dashboard also supports continuous intelligence improvement by helping analysts identify frequently occurring crime types, evaluate high-severity incidents, monitor response-time performance, assess unresolved cases, and investigate changes in crime activity over time.

Data Disclaimer:

This dashboard uses a fully synthetic dataset created for educational, analytical, and portfolio demonstration purposes only. The project is inspired by the fictional universe of Wayne Enterprises from DC Comics and does not represent any real corporate data.

Additionally, interactive filtering capabilities allow users to investigate specific crime types, severity levels, cities, countries, regional classifications, and time periods, enabling targeted intelligence reviews and strategic planning exercises.

The combination of crime-volume and severity analysis is particularly valuable because it allows decision-makers to distinguish between regions or periods experiencing high incident demand and those experiencing more serious criminal activity. Similarly, comparing overall resolution performance with high-severity resolution provides additional insight into the effectiveness of incident response and case resolution.

Overall, the dashboard serves as a centralized Wayne Enterprises Gotham City Intelligence Analysis platform that supports data-driven decision-making across criminal intelligence, security monitoring, geographic analysis, and incident response.

Tools & Data

- Visualization Tool: Power BI
- Dataset: Synthetic Enterprise Crime Intelligence Dataset
- Data Volume: ~100,000 records across multiple tables
- Data Model: Hybrid Star Schema
- Purpose: Enterprise Business Intelligence portfolio project simulating Wayne Enterprises' Gotham City crime intelligence, criminal activity monitoring, geographic analysis, and incident response analytics.
- Tables Used:
 - Fact Tables
 - Fact_CrimeData
- Dimension Tables
 - Dim_Date
 - Dim_Region
